AI IN THE BUILT ENVIRONMENT

COURSE NUMBER: DCP 4300

TERM: SPRING 2022

NUMBER OF CREDIT HOURS: 3

The planning, design, and construction of the built environment is on the verge of a fundamental transformation. A key element of this transformation is a radical shift in paradigm from planning and design representations of unconnected data to practices with an overwhelming amount of information-rich data. Artificial Intelligence (AI), in particular Machine Learning (ML), provides planners, designers, and constructors with new models and methods to engage in these data-heavy processes in order to synthesize meaningful information for all areas of their practice from planning to design to fabrication to erection. This course provides the College of Design, Construction and Planning (DCP) students an opportunity to learn about application of AI in their disciplines.

CLASS LOCATION: RINKER HALL ROOM 210

CLASS MEETING TIMES: TU 1:55 - 2:45PM and TH 1:55 - 3:50PM

INSTRUCTORS: Dr. Karla Saldana Ochoa and Dr. Charles Wang

OFFICE HOURS: (TBD)

COURSE WEBSITE: http://elearning.ufl.edu

COURSE DESCRIPTION:
An introduction to Artificial Intelligence (AI) and its applications to real world problems in planning, design and construction of the built environment. Includes application in professional practice in architecture, construction management, interior design, landscape architecture, sustainability and the built environment, and urban and regional planning.

PREREQUISITE KNOWLEDGE AND SKILLS:
Students who are interested in the UF AI Fundamentals and Applications Certificate must complete the following two courses prior to or in conjunction with DCP 4300:

- EEL 3872: Artificial Intelligence Fundamentals
- PHI 3681: Ethics, Data, and Technology
COURSE OBJECTIVES:

- Understand how AI technologies can be used to guide planning, design, and construction of the built environment.
- Apply existing AI models in architecture, construction management, interior design, landscape architecture, sustainability and the built environment, and urban and regional planning disciplines.
- Build a simple Machine Learning model.
- Understand the current limitations of machine learning technologies.

INSTRUCTIONAL METHODS:
The class meets three lecture hours per week.

COURSE POLICIES:

ATTENDANCE POLICY:
Attendance and participation in the class activities are required. Attendance and participation grade will be computed in proportion to the number of presence on the days the rolls were taken and participation on a given topic in the class forum. Requirements for class attendance and make-up quizzes, assignments, and other work in this course are consistent with university policies that can be found at:
https://catalog.ufl.edu/ugrad/current/regulations/info/attendance.aspx

COURSE EVALUATION
Students are expected to provide professional and respectful feedback on the quality of instruction in this course by completing course evaluations online via GatorEvals. Guidance on how to give feedback in a professional and respectful manner is available at https://gatorevals.aa.ufl.edu/students/. Students will be notified when the evaluation period opens, and can complete evaluations through the email they receive from GatorEvals, in their Canvas course menu under GatorEvals. Summaries of course evaluation results are available to students at https://gatorevals.aa.ufl.edu/public-results/

UF POLICIES:

UNIVERSITY POLICY ON ACCOMMODATING STUDENTS WITH DISABILITIES:
Students requesting accommodation for disabilities must first register with the Dean of Students Office (https://disability.ufl.edu/). The Dean of Students Office will provide documentation to the student who must then provide this documentation to the instructor when requesting accommodation. You must submit this documentation prior to submitting assignments or taking the quizzes or exams. Accommodations are not retroactive, therefore, students should contact the office as soon as possible in the term for which they are seeking accommodations.
UNIVERSITY POLICY ON ACADEMIC MISCONDUCT:
Academic honesty and integrity are fundamental values of the University community. Students should be sure that they understand the UF Student Honor Code at https://sccr.dso.ufl.edu/policies/student-honor-code-student-conduct-code/. Although joint work on assignments may be acceptable in some cases, duplication of an assignment, both manually or by computer, will be considered an act of academic dishonesty and dealt with accordingly. On all work submitted for credit by students at the university, the following pledge is either required or implied: "On my honor, I have neither given nor received unauthorized aid in doing this assignment."

GETTING HELP:
For issues with technical difficulties for E-learning in Canvas, please contact the UF Help Desk:
- Learning-support@ufl.edu
- (352) 392-HELP - select option 2
- https://lss.at.ufl.edu/help.shtml

GRADING POLICIES:
Grades will be computed according to the following scale:

A=93-100; A- =90-92.9; B+ =87-89.9; B=83-86.9; B- =80-82.9; C+ = 77-79.9; C=73-76.9; C- =70-72.9; D+ =67-69.9; D=63-66.9; D- =60-62.9; E<60.

- Attendance grade will be computed in proportion to the number of presence on the days the rolls were taken and participation grade is based on responding to a given discussion topic in the class forum.

- At the end of each module (URP, LAE, SBE, ARC, IND, and CM) an individual assignment will be given that covers topics that were discussed in that module. Specific evaluation criteria will be provided with each assignment.

- A final group project will be assigned that requires application of existing AI algorithms and tools to facilitate planning, design and construction of a building.
Architecture (ARC):
Architecture sits at the crossroads of concerns of both design and construction, but also of art, function, technique, culture, community, place, politics, history, etc. Architects draw influence from these sources and respond to integrate a wide variety of competing factors and criteria that can be simultaneously precise and vague, qualitative and quantitative, measurable and immeasurable. The application of cutting-edge technology has long impacted the design and production of architecture on many levels, be it theoretical, cultural, or technical. These advances have deep influences on the design process and the resultant architectural artifact. The module introduces and discusses the following topics:
What happens when an architect no longer draws explicitly, but works in collaboration with AI? The implication of AI technologies for the discourse of the discipline. Foundational technical know-how in the emerging ecology of AI applications.

Reading Materials:
AI & Architecture: An Experimental Perspective

Stanislas Chaillou, Harvard Graduate School of Design | Feb. 24th, 2019
https://towardsdatascience.com/ai-architecture-f9d78c6958e0

Software/Language:
Rhino+Grasshopper+Galapagos
PyTorch/TensorFlow
StyleTransfer/StyleGAN

Construction Management (CM):
AI has been implemented in several domains, and the construction industry has also seen the value of using AI-driven solution methods to increase efficiency and decrease risk. Construction researchers and professionals have been exploring different Machine Learning, Computer Vision, Natural Language Processing methods for various applications such as design optimization, scheduling, estimating, project documentation, safety inspection, and construction project monitoring. AI abilities in the construction together with misconceptions around its capabilities, and its limitations will be discussed.

Reading Materials:

**Software/Language:**  
Matlab  
Pycharm  
Python  
Pytorch

**Interior Design (IND):**  
Using AI to Create Human Centered Interior Environments  
The use of intelligent and assistive technologies to guide the design of the environments in which we live, learn, and work is growing at an increasing rate. Interior Design involves the creation of data driven, well-conceived, and adaptive spaces by expert practitioners that support and foster human resilience. Using AI-based approaches such as Human in the Loop (HITL) Machine Learning leverages both numerical data as well as the opinions and viewpoints of people occupying a space to optimize both design functionality and human experience. This approach to AI-guided Interior Design offers a vehicle for applying both human and machine intelligence to forecast a design’s ability to meet expected and evolving performance outcomes. Examples of how AI can be used to inform space programming and environmental planning will be reviewed. For example, how Machine Learning can be used as an evidence basis to guide the design of spaces in safety critical environments. Additionally, possibilities of using AI and Distributed AI in conjunction with discipline specific software platforms such as AutoCAD and Revit will also be discussed.

**Reading Materials:**  

**Software/Language:**  
Python Jupyter Notebooks

**Landscape Architecture (LAE):**  
The application of Artificial Intelligence and Machine Learning in Landscape Architecture is emerging. AI and ML could efficiently collect, analyze and digest information from the built environment for Landscape Architects. AI and ML provide Landscape Architects great tools for innovative design and creation. The lifestyle that AI changes, provides opportunities and challenges for Landscape Architects to create a desirable built environment. AI and ML also help us understand, monitor and conserve nature.

Software/Language used:
Python

Sustainability and the Built Environment
The Sustainability and the Built Environment (SBE) major and minor interweave broad principles and practices from the DCP professions in a more generalist framework through the four dimensional lens of ecology (planet), culture (purpose), society (people), and economy (prosperity). Within the Geodesign Specialization, SBE students focus on the science and applications fusing design thinking with geospatial data analytics and decision-support to solve problems related to land use change and human habitation. Computer vision, crowdsourced geospatial data, digital twins, procedural models, and related decision support technologies like building information modeling (BIM) and geographic information systems (GIS) are increasingly moving toward cross-scale interoperability and revolutionizing how we sense, make sense, and solve problems of sustainability as we cope with change and facilitate adaptive capacity and community resilience in the face of uncertainty. AI and machine learning empower geospatial problem solving and may improve the monitoring, measuring, and modeling of natural resource conservation and social-ecological system management, may have the capacity to predict poverty from remote sensing data, may empower the supply and demand side infrastructure and information management of the emerging smart grid, and may cultivate community resilience and emergency response.

Reading Materials

Urban and Regional Planning (URP):
The world is becoming more urban while large quantities of data are being generated by humans about the built environment on an unprecedented scale. Urban data are pervasive, and computing is ubiquitous that creates a great opportunity for reinvigorating and revamping traditional urban planning. According to the National Science Foundation, "Knowledge of computer science and computer programming is becoming a necessary skill... in marketing, advertising, journalism, and the creative arts." Urban planning is no exception. Both the pervasiveness of ubiquitous sensor technology and the growth of information technology produce large quantities of data and making sense of these gathered data requires computer and data science skills. Examples of technologies that are already highly concentrated in the built...
environment include, but not limited to autonomous vehicles, embedded environmental sensors, distributed intelligence and control in infrastructure, the sharing economy, and social networks. To understand and take advantage of these vast amounts of new data, the traditional data analysis methods in the urban planning field is insufficient, and thus requires advanced data analysis skills for large data such as machine learning, and deep learning.

**Reading Materials:**
Urban Analytics (Spatial Analytics and GIS) First Edition

**Software/Language used:**
Python
## COURSE SCHEDULE:

<table>
<thead>
<tr>
<th>Week</th>
<th>Discipline</th>
<th>SUBJECT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Week 01</td>
<td>DCP</td>
<td>Introduction to AI</td>
</tr>
</tbody>
</table>
| Week 02 | URP | Urban Analytics for Smart and Resilient Cities  
Introduction:  
Big data at urban scale  
Overview of urban analytics/computing approaches  
Smart cities applications (transportation, housing)  
Resilient cities applications (hazards, SLR, climate change)  
Leveraging big data and AI to understand social equity |
| Week 03 | URP | Technical Contents:  
AI and sentiment analysis for public perception mining (natural language processing)  
AI and human mobility analysis (geospatial data & clustering)  
Language: Python |
| Week 04 | SBE | Using AI and machine learning to empower geospatial problem solving:  
- Monitoring, measuring, and modeling of natural resource conservation and social-ecological system management,  
- Predicting poverty from remote sensing data,  
- Empowering the supply and demand side infrastructure and information management of the emerging smart grid,  
- Cultivating community resilience and emergency response. |
| Week 05 | LAE | AI and Machine Learning in Landscape Architecture research on public space and public life and environmental conservation. Technology on modeling and simulation of natural disasters, urban and ecological processes. |
| Week 06 | LAE | AI and Machine Learning in future Landscape Architecture design and professional practice. |
| Week 07 | DCP | Guest Speakers - Application of AI Technologies in URP, SBE, and LAE |
| Week 08 | ARC | Technology and its impact on the profession  
Determinants and constraints  
Contemporary generative design tools: simulation based procedural modeling |
| Week 09 | ARC | Collaborative AI: Machine Learning and Artificial Neural Networks  
Image-based Convolutional Neural Networks (CNN)  
Generative Adversarial Networks (GAN) |
| Week 10 | IND | Demystifying the role of AI in Human-Centered Design  
Introduction to public and proprietary data resources for use in Machine Learning |
|---------|-----|-----------------------------------------------------|
| Week 11 | IND | Understanding ways to include human perspectives and  
expertise into AI  
The potential of using AI as an interactive and vital tool in Interior Design practice |
| Week 12 | CM  | Augmented and explainable intelligent planning and control of  
construction processes:  
Know when to use supervised versus unsupervised versus  
semi-supervised versus reinforcement training techniques.  
Learn the basics of shallow versus deep neural networks versus  
Support Vector Machines versus basic Statistical Regression.  
Understand how to train, test, and validate a machine learning  
model to achieve maximum utility.  
Understand the current limitations of machine learning technologies |
| Week 13 | CM  | Computer Vision for Construction Safety Application:  
Understand the Basics of computer vision & deep learning,  
e.g., object detection, segmentation, 3D reconstruction  
Using AI to detect selected safety hazards in images collected from construction site |
| Week 14 | DCP | Guest Speakers - Application of AI Technologies in ARC, CM,  
and IND |
| Week 15 | DCP | Final Project Presentations |

Disclaimer: This syllabus represents the current plans and objectives. As we go through the semester, those plans may need to change to enhance the class learning opportunity. Such changes, communicated clearly, are not unusual and should be expected.
